1) Implement the Propositional basic logic gates along with implies and biconditional

```
 def main():
 a=False
b=True
print("not operation of a= ",not(a))
print("or operation of a and b= ",(a or b))
print("and operation of a and b= ", (a and b))
print("xor operation of a and b= ", (a ^ b))
print("xnor operation of a and b= ", not(a ^ b))
print("implication of a and b= ", imp(a,b))
print("Bidirectional operation of a and b= ",bidir(a,b))
def imp(a,b):
  return (not(a)) or b

def bidir(a,b):
    return (imp(a,b) and imp(b,a))
if __name__ == '__main__':
    main()
```

OUTPUT

```
not operation of a=  True
or operation of a and b=  True
and operation of a and b=  False
xor operation of a and b=  True
xnor operation of a and b=  False
implication of a and b=  True
Bidirectional operation of a and b=  False
```
